Western Australia

Dear John,

Recently we Treated the CV Joints in our Toyota landcruisers at a Underground Mine in Kambalda, Western Australia.

Problem being the washout that occurs to the CV's due to High Salinated ground water together with harsh underground conditions determine a short life for these Constant Velocity Joints.

After coating the new CV Joints with Oil Conditioner then packing them with Militec-1 EP Grease we were very pleased in seeing an increase in life of the CV's by 300% .

Even though we have only started using Militec-1 on this constant problem area the results speaks for themselves and the potential for reducing unscheduled downtime in this environment is enormous.

Regards

JH Du Preez
